

Twilio AI SMS Automation – Project Summary

Project Overview

This automation is designed to handle inbound and outbound SMS communication using Twilio, Google Sheets, and an AI Agent. The system automatically reads phone numbers from Google Sheets, filters them by area code, sends SMS messages, receives replies, classifies lead intent, and updates lead status without manual intervention.

Primary Goals

- Send SMS messages only to valid phone numbers based on area code.
- Automatically respond to inbound SMS messages using AI.
- Classify leads as Hot, Warm, or Cold based on message intent.
- Keep Google Sheets synchronized with message and lead status.

Outbound SMS Flow (Google Sheets → Twilio)

- Rows are read from a Google Sheet containing multiple phone number columns.
- Phone numbers are extracted, cleaned, and normalized.
- Only phone numbers matching the allowed area code (904 / 352 / 850) are kept.
- Invalid or mismatched area-code numbers are skipped without stopping the workflow.
- Validated numbers are sent SMS messages using Twilio.

Inbound SMS Flow (Twilio → AI → Google Sheets)

- Twilio sends inbound SMS replies to a webhook endpoint.
- The workflow looks up the sender's phone number in Google Sheets.
- An AI Agent analyzes the message content and intent.
- The lead is classified as Hot, Warm, or Cold.
- A context-aware reply is sent back via Twilio.
- Lead status is updated in Google Sheets for tracking and follow-up.

Key System Components

- Twilio – SMS sending and receiving.
- Google Sheets – Source of leads and status tracking.
- AI Agent (OpenAI) – Message understanding and intent classification.
- n8n Workflow – Orchestration, routing, and automation logic.

Reliability & Safety Measures

- Area-code filtering prevents cross-region messaging errors.
- Invalid numbers are skipped without breaking the workflow.

- Duplicate messages are prevented through controlled processing.
- Lead status updates ensure consistent data across systems.

Conclusion

This automation provides a scalable and intelligent SMS communication system. By combining Twilio, Google Sheets, and AI, it eliminates manual follow-ups, improves response accuracy, and ensures leads are handled based on real intent. The workflow is designed to be robust, easy to extend, and safe for production use.
